

DAY 1

1. What is HTML?

HTML stands for Hyper Text Mark-up Language.

HTML is used to:

- Create the structure of a website
- Tell the browser what each part is

HTML is not used to:

- Add design
- Add logical behaviour

2. What HTML really does

HTML describes:

- Headings
- Paragraphs
- Images
- Links
- Forms

HTML is not a programming language because it doesn't have conditions, loops, calculations

3. How a website Loads

- 1) You type a website address
- 2) The browser requests the page
- 3) The browser receives an HTML file
- 4) The browser reads the HTML
- 5) The page appears on the screen

4. HTML Files

HTML files ends with .html

Example: index.html

Can be opened with: any browser, any text editor

HTML doesn't need internet to work.

DAY 2

5. Why we need Tags

A browser needs to know:

- What is heading
- What is text
- What is a link
- What is an image

HTML uses tags to give meaning to content

6. What is an HTML Tags?

A tag is a keyword wrapped in angle brackets < >

Example: <p>

Most tags come in pairs:

<p>Text</p>

- Opening tag- <p>
- Closing tag- </p>

7. Why HTML needs structure

A browser is not intelligent.

It needs clear instruction about:

- What type of document this is
- Where information is
- What should be shown to the user

8. The basic HTML template

Every html page starts with this structure:

```
<!DOCTYPE html>
<html>
  <head>
    <title>My First Page</title>
  </head>
  <body>
    Hello World
  </body>
</html>
```

9. <!DOCTYPE html>

- Tells the browser: “This is an HTML5 document”
- Prevents browser confusion
- Always comes first

10.<html>

- Wraps the entire page
- Everything must be inside it

11.<head>

The brain of the page

Contains:

- Page title
- Meta information
- Links to CSS

The head is not visible to users.

12.<title>

- Appears in the browser tab
- Important for SEO and identification

13.<body>

The visible part of the website.

Contains:

- Text
- Images
- Links
- Buttons
- Forms

DAY 3

14.What is an HTML Element?

An element includes:

- Opening tags
- Content
- Closing tag

Example: `<p>This is a paragraph</p>`

15.Some HTML Elements

- `<h1>` - `<h6>` - define heading from most important h1 to least important h6
- `<p>` - defines a paragraph of text
- `<br>` - creates a line break
- `<hr>` - creates a horizontal line
- `<a>` - creates a clickable link
- `<img>` - display an image
- `<ul>` - creates an unordered list
- `<ol>` - creates an ordered list
- `<li>` - defines an item inside a list
- `<table>` - creates a table
- `<tr>` - defines a table row
- `<th>` - defines a table header cell
- `<td>` - defines a table data cell
- `<form>` - creates a form to collect user input
- `<input>` - creates an input field
- `<label>` - describes an input field
- `<button>` - creates a clickable button

16.Empty (self-closing) Elements

Some elements have no content.

Example: `<img>` , `<br>` , `<hr>`

17.What are Attributes

Attributes gives extra information about elements.

They are written inside the opening tag.

Example: `<img src= "photo.jpg">`

- `src`- attribute name
- `"photo.jpg"`- attribute value

18.Common Attributes

- `src`- image source
- `href`- link destination
- `id`- unique identifier
- `class`- group identifier
- `alt`- image description

DAY 4

19.HTML Comments

Comments are ignored by the browser.

Used for:

- Notes
- Explaining code
- Temporarily hiding content

Syntax: `<!-- -->`

Example: `<!-- This is a comment -->`

20. Why Headings Matter

Headings are used to:

- Organize content
- Show importance
- Help browsers and search engines understand the page

Rules

- Every page should have only one `<h1>`
- Headings must be used in order
- Do not skip levels (don't jump from h1 to h4)

Example: `<h1>School Website</h1>`

`<h2>About the school</h2>`

`<h3>Our Mission</h3>`

`<h2>Contact Information</h2>`

21. Paragraph Element (`<p>`)

The `<p>` tag is used for normal text content.

Use paragraphs for:

- Descriptions
- Explanations
- Long text

Rules

- Each paragraph should express one idea
- Do not use `<br>` to create paragraphs
- Browsers automatically add spacing

Weekly Practice:

- 1) Create a title
- 2) Create a 1st heading
- 3) Create a paragraph saying "My school is a place where students learn knowledge, discipline, and responsibility."
- 4) Create another paragraph saying "It provides education that helps students prepare for their future."
- 5) Create a 2nd heading
- 6) Create a paragraph saying "Education helps people gain skills and understanding of the world."

- 7) Create another paragraph saying “It allows students to solve problems and make better decisions in life.”
